in this work, the bianca model was applied to simulate the survival of cells irradiated with protons and carbon ions delivered to a tumour located in the distal part of the human torso. bianca has been applied to predict cell survival in experimental situations previously described in publications, such as those of et al (2018) and et al (2018), but it is the first time that the model is applied to simulate the survival of cells in a typical patient treatment scenario. for that purpose, the model input parameters have been derived from the bianca database describing the cell survival of v79 cells as a function of ion type and energy, and then bianca was applied to predict cell survival in two opposing fields of range-equivalent protons or c-ions, assuming that the dose absorbed by the tumour is uniform within the distal part of the body (i.e. in the region where the ions are spread). the dose absorbed was calculated using the pencil-beam approximation; the dose was normalized at the centre of the region with the highest dose. the bianca simulations were carried out at the hit clinic of the german cancer research center in heidelberg, and the results obtained for the c-ion and proton beams are compared with the experimental data of carante et al (2018), which were obtained by exposing human diploid fibroblast cells (hdf) to accelerated carbon ions and protons delivered in the distal part of the body to a tumour located in the distal part of the body. her father and mother were so excited about this opportunity that they told everyone about the mission call. when bianca and her boyfriend told their family, her father then told the whole congregation at sunday service, with an audible gasp of relief, because he knew the congregation would support the young missionaries. on may 18, 2012, bianca and her boyfriend were given the privilege of baptism. when the missionaries left the house, bianca and her father cried and hugged. bianca couldnt believe that god had answered her prayers so fast.
